

4장 실습_리스트_1

- 다음과 같은 출력이 발생하도록 강의자료를 보며 코드를 작성할 것

```
1. Print list L
L = [27, 19, -1, 43, 28, 1]
2. Sort the elements in list L in descending order
L = [43, 28, 27, 19, 1, -1]
3. Delete the last element in list L, print the deleted data
Deleted data is -1
L = [43, 28, 27, 19, 1]
4. Add the deleted data as the first element in list L
L = [-1, 43, 28, 27, 19, 1]
5. Receive the index number of list L and delete the element at that location if it is a valid index number
Enter index num : 4
Valid index number
L = [-1, 43, 28, 27, 1]
6. Add the entered data to the end of list L
Enter any type data : sogang
L = [-1, 43, 28, 27, 1, 'sogang']
7. Print out whether the received data exists in list L
Enter data to find : sogang
Found!
```

출력 예시 1

1. Print list L

L = [27, 19, -1, 43, 28, 1]

2. Sort the elements in list L in descending order

L = [43, 28, 27, 19, 1, -1]

3. Delete the last element in list L, print the deleted data

Deleted data is -1

L = [43, 28, 27, 19, 1]

4. Add the deleted data as the first element in list L

L = [-1, 43, 28, 27, 19, 1]

5. Receive the index number of list L and delete the element at that location if it is a valid index number

Enter index num : 6

Invalid index number : out of bound

6. Add the entered data to the end of list L

Enter any type data : 19

L = [-1, 43, 28, 27, 19, 1, '19']

7. Print out whether the received data exists in list L

Enter data to find : 28

No found!

출력 예시 2
